

**ARK MOUNTAIN** was a geographic prophecy of how the ark remains would finally look in our age.

The crenelated and eroded northern cliffs ( left ) match the Ark mold today...

*Analysis by David Allen Deal October 2006*

While the central part is disrupted by a large rock fall roughly the same place as the sharp rock that penetrated the hull. To the right of that the mountain looks just like the southern part ( right ) of the ark impression as it ascends to the pointed stern. The Ark does not protrude much above the local terrain here, just as the Ark mountain ( Mt. Mashu -Ziyaret ) does not present a high cliff face. It is remarkable that the ark finally eroded to represent the same general look as the prophetic mountain it landed on 4,428 years ago ( as of 2006 ).
